Hello, and welcome to the Christmas 2013 edition of the 4GEE Mobile Living Index. We have delved deep into our network to find trends and insights that we think would be of interest. We’ve also interviewed 1,000 of our ever-expanding 4G customer base to find out how they are using our superfast connectivity to do more on the move.

We now have twice as many 4G customers since the first EE Mobile Living Index, and we are seeing patterns emerge that demonstrate the true value of 4G to the people and businesses of Britain.

Most significant is the rapidly growing use of social media over 4G. In six months, social media use has risen from 13% to now represent 18% of our overall 4G network traffic. With 4G, people don’t wait to get home to keep in touch with friends and family via social media.

The Index also shows that 4G is opening up opportunities for consumers and retailers, with a significant increase in the amount of mobile shopping that’s taking place across the network. According to our survey, the number of 4GEE customers set to Christmas shop via mobile will nearly triple because of 4G. It’s a trend that spans the range of EE demographics too, with 13% of pensioners on 4G contracts expecting to do some Christmas shopping on their mobile.

We’ve also looked at other aspects of consumers’ mobile lives, specifically voice calls. Highlighting the continued dominance of mobile we found that four-fifths of consumers say they haven’t used a public phone box over the last five years, and 18% say they haven’t used their home phone. We are seeing this reflected on our network, with a 25% increase in call volumes since the beginning of 2012. And that is why at EE we are committed to delivering a first class voice – as well as data – experience.

I hope you enjoy the latest EE Mobile Living Index and find the information within it useful and interesting. I fully expect that by the next edition, we’ll see people are embracing 4G and using it to make their lives easier, better and more connected.

Olaf Swantee, CEO, EE
PROFILE OF THE 4G USER
WHO IS USING 4GEE?

As 4G becomes more geographically widespread and universally available the spread of ages is beginning to widen. Across the 1.2m 4G users, more 18-24 year olds and over 65s are taking advantage of the range of affordable plans and devices. Even new 4G users, who are likely to be less tech-savvy than early 4G adopters, are rapidly changing the way they use mobile devices. We are still seeing 43% of customers use fewer or no Wi-Fi hotspots and 23% cut down on home broadband use.

4G USER BEHAVIOUR
4G vs 3G: Consumers share more on 4G

It is a long-held belief that 4G will see mobile begin to dominate social media. So vital is mobile to social media that Facebook's announcement in October that mobile advertising now accounts for just short of half of the firm's revenue saw shares soar close to 10%.

There has been a significant shift towards heavy social media use on 4G. Social media counts for 18% of all 4G traffic, up from 13% in August, and four percentage points more than on 3G. Users are sharing more photos and videos on the go on social media, and it is even beginning to eat into some of the percentage of overall traffic accounted for by traditional video services. Without having to worry about buffering or waiting for content to load, consumers are doing more, in less time, on social media.

What are people doing with 4G?

What are people doing with 3G?

Bracketed figures from August EE Mobile Living Index
For the first time, we are able to study how 4G usage looks against the traditional 3G user. Here, across four different types of application (maps, instant messaging, gaming, and audio) we can see that, overall, 4G user habits are distinct. Though we do see more mapping on 4G in general, the variance between applications used is not vast. iOS Maps is slightly more popular on 4G due to the preponderance of iPhones on 4G. In terms of instant messaging, the success of WhatsApp – a data-driven messaging app that allows groups and picture messaging – shines through, with around 80% of all instant messaging data taking place over the service.

Real variances between 4G and 3G can be seen in audio and gaming applications. In the latter, Playstation and Steam are far more popular on 4G, perhaps due to bundling of services and the slightly higher proportion of Windows phones on 3G services. Bundling has a huge impact on audio services, as does the consistency of 4G connections. Deezer and Spotify see massive leaps on 4GEE, as users run apps and stream on the go, and also take advantage of the 25m songs available with the Deezer add-on, included with most 4GEE packages.
4G VS 3G: CONSUMERS SWITCH TO DATA-HEAVY APPS ON 4G

There are no major surprises in most popular types of data session over 3G services. Video calling appears relatively high, with three video calling applications in the top ten, because even though there are fewer sessions, the volume of data within each session is comparatively high against normal web browsing (any of the ‘HTTP’ applications).

On 4G, the changes are marked. Social media, as demonstrated on page 7, is driving 4G data use. Facebook and YouTube both rank more highly than on 4G, and both Instagram and Twitter move into the top ten. Music streaming applications Deezer and Spotify also contribute big numbers in terms of data across the 4G network, implying that the 4G user is much more likely to stream music than the 3G user, who may simply revert to music already stored on their mobile device.

SHOP ON THE HOP
4G is rapidly changing the way people shop online. Increasingly the always online, always mobile, generation is conducting its shopping on-the-go. 66% of 4G users now shop on mobile, and 23% shop more since having a 4G connection.

Of those that do, it is men that are the big spenders, with nearly a quarter spending more than £200 per month. Spending among women is rising rapidly, with nearly double the number spending over £200 (15%) than recorded in the August edition (8%). In fact, when men and women results are combined we see a big rise in the percentage spending over £100 (54%, compared with 43% in August).

Again, fashion is the most popular purchase, with 24% of all cash spent on these items.

SMARTPHONES ARE PUSHING THE CHRISTMAS SHOP ON MOBILE

With Christmas around the corner, we asked 4G users if they were prepared to shop for Christmas gifts using a 4G connection. Whereas 15% of users did some Christmas shopping online in 2012, this year more than a third (39%) expect to buy presents on their mobile device.

Consumers increasingly trust the security and the quality of experience when shopping on mobile.

With most major retailers now offering mobile-optimised sites, the consistency and speed of a 4G connection is allowing consumers to browse and spend with confidence. Even 13% of pensioners surveyed plan to shop on mobile for Christmas this year, and a quarter (27%) of those that did spend money on mobile purchases last Christmas expect to spend more this time around. It all means that Santa will have to visit warehouses as much as he will residential areas this year.

**Christmas shopping**

*Did you Christmas shop on your mobile last year?*

- Yes: 15%
- No: 85%

*Will you Christmas shop on your mobile this year?*

- Yes: 39%
- No: 61%

**Source:** TNS

- 50% of those that did shop on mobile last Christmas spent more than £100
- 47% of 25-34 year olds will spend on mobile this Christmas (and 13% of over 65s)
- 27% of those that shopped on mobile last Christmas are set to increase mobile spend this year
Evolving Behaviour
THE UK IS MOBILE: 18% OF 4G USERS HAVE NEVER MADE A LANDLINE PHONECALL

As mobile use has accelerated – a TNS survey this year revealed 128% penetration of mobile phones in the UK – so using a mobile over traditional forms of voice communication is becoming the norm. 79% of 4GEE users have not used a phone box for at least five years, of which 24% have never used one at all. Among 18-24 year olds, 44% have never felt the need to use a public phone box.

This pattern of use is mirrored in the home phone experience. Though many people have landlines, the number using them for voice calls is decreasing. 22% haven’t used a home phone from more than five years, a figure rising to 31% for 18-24 year olds. Conversely, 77% of over 65s have used their home phone in the last week, proving the technology still has a place for those that have grown-up with it.

![Graphs showing usage of home and public phones](Source: TNS)
THE CONSUMER/B2B CROSSOVER: HOW 4G IS ENABLING WORK ON-THE-GO

Consumers armed with smartphones have been using them to catch-up on work for some time now. With 4G, consumers are able to fit in work where and when they want. 40% of 4G customers use their smartphone for work every day, whether it be catching-up on emails, sending texts or exchanging large files.

This pattern of use is also reflected on the commute. 18% of 4G users take time on their commute to check work emails, effectively starting the working day earlier as a result. Of those that do something else, the most popular activities are browsing the internet – perhaps catching-up on the morning’s news or gossip – or listening to music. As network stats on page 8 show, that will often be using the Deezer app.

How often do you use your phone for work?

- 35% Every day
- 13% A few times a week
- 12% Sometimes
- 10% Never
- 40% Never

What do you do with your phone on your commute?

- Browse the internet: 29%
- Listen to music: 22%
- Use apps: 19%
- Work or check work emails: 18%
- Make calls: 17%
- Gaming: 10%
- Social networking: 8%
- Text: 7%
- Read: 5%
- Other: 8%

Source: TNS
The ubiquity of mobile phones continues to change the way people act, and our survey shows that, though phone use is widespread, there are still situations where people think a handset should be kept in a pocket or handbag.

Unsurprisingly, though, 4G users are flouting their own rules. Though 31% consider it unacceptable to use a mobile during a meeting, 9% do anyway.

One of the great drivers of mobile phone use is, of course, social media. Comparing this edition with results from the first 4GEE Mobile Living Index, results for how often people use social media sites were fairly flat, with a quarter (24%) still visiting social media sites more than ten times a day.

**When is it socially unacceptable to use your phone/when do you anyway?**

<table>

Bracketed figures from August EE Mobile Living Index
SMARTPHONES ARE PHONES TOO

Much of what consumers do with their mobile devices is driven by the computing capability of smartphones. Mobile access to the internet is a huge part of how mobile is used. But it isn’t all about data. Bucking perceived trends, consumers are making a growing number of phone calls on the EE network. And a higher portion than ever of those calls are taking place on the 3G layer of the network, in line with the growing penetration of smartphones and decreasing number of 2G-only featurephones. Even as phone calls grow in importance, the dropped call rate on the EE network is decreasing, and is at a lower rate than at any point during 2012.

Number of calls (across the EE network)

Quarterly periods in 2011, 2012, and 2013

Number of calls have increased 25% since the beginning of 2012

3G calls have increased in number by over 50% since the beginning of 2012

Dropped calls in London have improved by 36% since week 31 of 2013

Source: EE
Here we look at some of the ways in which customers are accessing the mobile internet and for how long. With the number of 4G users on 4GEE roughly doubling since the last EE Mobile Living Index and the demographic of users widening, it was expected that there may be a fall in the amount of time the average user spends on the internet, due largely to early adopters being more tech savvy.

However, we are still seeing more than one-in-five consumers spending more than three hours a day accessing the internet via mobile. And the number of users doing so for more than five hours has risen to 10%. This coincides with a fall in the number of customers accessing their mobile over Wi-Fi or home broadband, as they continue to substitute the latter service for a consistent 4G experience.

**Mobile phone over mobile network**

- 36% (33%) spend more than three hours.
- 12% (14%) spend more than five hours.

**Tablet over mobile network**

- 50% (48%) spend more than three hours.
- 8% (9%) spend more than five hours.

**Mobile over Wi-Fi/ home broadband**

- 32% (30%) spend more than three hours.
- 14% (14%) spend more than five hours.

Source: TNS

Bracketed figures from August EE Mobile Living Index
Home broadband use continues to slide among 4G users, with the number spending more than three hours accessing the internet through this sort of connection slipping from 54% to 45%. The same pattern exists in public Wi-Fi, with more customers spending less than an hour a day using the services, perhaps as a result of EE’s 4G rollout moving into areas where public Wi-Fi is scarce.

Using 4G and work broadband, use remained largely stable, indicating that customers are getting their activity completed quickly on mobile networks rather than having to fall-back onto home broadband and public Wi-Fi networks.

### Time spent accessing the internet

#### 4G network
- 5+ hours: 11% (14%)
- 3-5 hours: 36% (31%)
- 1-3 hours: 40% (42%)
- Less than one hour: 13% (13%)

#### Work broadband
- 5+ hours: 27% (24%)
- 3-5 hours: 36% (39%)
- 1-3 hours: 10% (15%)
- Less than one hour: 27% (21%)

#### Public Wi-Fi
- 5+ hours: 2% (20%)
- 3-5 hours: 17% (20%)
- 1-3 hours: 77% (74%)
- Less than one hour: 3% (4%)

#### Home broadband
- 5+ hours: 16% (15%)
- 3-5 hours: 18% (19%)
- 1-3 hours: 27% (35%)
- Less than one hour: 36% (33%)

### What are you doing more of since switching to 4G?

- Web browsing: 50% (47%) (47%)
- GPS-based services: 37% (37%) (37%)
- Downloading apps: 36% (35%) (35%)
- Streaming video content: 36% (34%) (34%)
- Social media: 34% (31%) (31%)
- Using apps that need daily updates: 28% (29%) (29%)
- Downloading or streaming music: 26% (30%) (30%)
- Using online banking: 25% (20%) (20%)
- Visiting sports or news websites: 24% (25%) (25%)

Source: TNS

Bracketed figures from August EE Mobile Living Index
Instagram Activity Peaks on Halloween

Instagram accounts for around 3% of all 4G traffic, with customers enjoying posting high-res pictures on the go. We saw our biggest peak for the year on Instagram at approximately 9pm on Halloween, when parents tucked their trick-or-treating children up in bed and found some time alone to get on social media (and also around the time revellers of a more alcoholic nature started to upload their shots).

Source: EE
On Sunday 27 October, Chelsea played Manchester City in a Premiership football match. We tracked the day’s activity in and around Chelsea’s stadium, as well as around some other important footballing locations (Manchester United’s Old Trafford ground, Arsenal’s Emirates, and Liverpool’s Anfield) to see if a match televised live has any overall effect on our network.

There was, predictably, huge activity around Stamford Bridge around time of match as people shared images and looked at information over 4G and also watched the match nearby.

But also, in Liverpool, where the stadium is in the middle of a very urban area, we saw a peak at the time of the match, most likely as customers watched on Sky Go or other services.

More popular matches see as much as a 10% upsurge in overall network activity.

Source: EE
BIG MATCHES SEE A 10% UPLIFT IN 4GEE TRAFFIC

Looking at what is contributing to the aforementioned up-to 10% upward shift in network activity (see previous page), we see Sky Go activity peaks when live football is on. People are increasingly using their existing Sky packages and the 4G service to watch matches on-the-go. Streaming services also rise around the same time.

There is even an 11pm peak in streaming services on Premiership weekends on the Saturday when both Match of the Day and Sky’s highlight shows are televised. Customers have confidence in the speed and quality of 4GEE to use OTT services such as Sky Go and Deezer (see page 8) over the network, moving television and music from traditional hardware (television, radio, and even computer) to mobile devices.

Source: EE
A WEEK ON THE 4G NETWORK

Here we have a snapshot of Covent Garden, Heathrow and Wembley over ten days in October.

The massive peak at Wembley was for the Jaguars v 49ers American Football match on 27 October.

We also see Heathrow has daily peaks around the flying hours and Covent Garden lights-up at lunchtimes, in the evening, and throughout the weekend. Knowing that certain areas will experience very high peaks allows our network team to make provisions for data use. The network has to have capacity to cope with these peaks even though 99% of the time use will be a lot lower.
